Introduction

The **Online Rental and Ticketing System (Super track)** is an innovative project developed by **Daju-Vai Pvt. Ltd.** to revolutionize the way people rent vehicles and book travel tickets in Nepal. The platform offers a seamless, user-friendly interface where users can rent bikes, scooters, and cars, as well as book intercity bus and microbus tickets — all in one place. By digitizing these services, our goal is to save time, improve convenience, and provide more transparent options for both travelers and service providers. This project supports the vision of a Digital Nepal by making travel planning easier, faster, and more accessible.

Problem Satatement

In Nepal, the process of renting vehicles or booking intercity travel tickets remains largely physical or dependent on informal channels such as phone calls, local agents, or social media platforms. These traditional methods are often time-consuming, unstandardized, and lack transparency, making it difficult for users to compare prices, check availability, or trust the reliability of services. Moreover, there is currently no centralized online system that combines both vehicle rentals (bikes, scooters, cars) and ticket bookings for public transport (buses, microbuses, etc.) in a single, integrated platform.

This fragmentation creates significant inconvenience for travelers, who must rely on multiple sources or physically visit rental offices and ticket counters. It also poses challenges for service providers, who struggle to manage bookings, reach potential customers, and operate efficiently. The absence of a unified digital solution not only hampers user experience but also limits the potential for modernizing Nepal's transportation and mobility ecosystem.

Objectives

Develop an Online Platform for Vehicle Rental and Travel Ticket Booking

The primary objective is to design and implement a digital platform that enables users to conveniently rent vehicles (such as bikes, scooters, and cars) and book travel tickets for buses and microbuses. The platform will integrate these services into one seamless system, reducing the need for in-person visits or third-party agents.

Ensure Ease of Use and User-Friendliness

The platform will focus on providing a smooth and intuitive user experience. A clean user interface (UI), simple navigation, responsive design for mobile and desktop, and quick loading times will be prioritized to make the platform accessible to people of all digital literacy levels.

Facilitate Seamless Booking of Public Transportation Tickets

The platform will allow users to book travel tickets for intercity buses and microbuses. Features such as route details, seat selection, travel schedules, and fare information will be available to help users make informed decisions.

Support the Vision of a Digital Nepal

This project aligns with the national goal of digital transformation by bringing essential transportation services online. By promoting digital access and self-service tools, it contributes to building a smarter, more connected society and helps bridge the technological gap in public service delivery.

SCOPE

Vehicle Rental Module: The frontend will allow users to view available bikes, scooters, and cars. Users can explore vehicle details like type, price, and availability, and simulate the rental process through interactive UI components.

Travel Ticket Booking System: The platform will include pages for browsing intercity bus and microbus routes. Users can view travel schedules, seat availability (visually), and simulate ticket booking through the frontend design.

Responsive Web Design for Multiple Devices

The platform will be built with a responsive layout that adjusts smoothly across different screen sizes, ensuring a seamless experience on desktops, tablets, and smartphones.

SIGNIFICANCE

1. Promote Digital access to transportation services

This project helps bring vehicle rentals and ticket booking services online, making them accessible to people from anywhere, anytime—supporting Nepal’s move toward digital transformation.

2. Saves Time and Increases Convenience

Users no longer need to visit rental offices or bus counters. They can compare, book, and pay for services online quickly, making travel planning faster and more convenient.

3. Improves Transparency and Trust

By showing clear information about prices, availability, and routes, the platform builds trust between service providers and users, reducing confusion and hidden costs.

4. Supports Local Businesses and Tourism

Vehicle rental companies and transport operators can reach more customers through the platform, helping them grow their business while also making travel easier for tourists and locals.

METHODOLOGY

1. Information Gathering & Research

- Analyze existing vehicle rental websites (like Zoomcar, Revv, or Ola Drive) to understand essential features and layouts.
- Discuss and finalize the website's structure and page flow within your team using Figma.

2. Planning & Design

- Decide on a color scheme, font styles, and branding to ensure consistent UI.
- Break down tasks among team members (e.g., who works on which page or component).

3. Development Phase

After creating the sample layout of our project in Figma we will start working on it using three basic languages: HTML, CSS and JavaScript.

As HTML is used to define the structure and layout of our project's content we will create a user friendly design using CSS and JS.

JavaScript will add interactivity like: form validation (e.g., check if user filled in all fields), simple confirmation messages (e.g., alert on "Book Now") and more.

4. Testing

- After preparing our project we will start testing the site on different screen sizes to ensure responsiveness.
- Validate all forms (if any) to make sure JavaScript handles incorrect inputs.
- Check that navigation works properly and all pages are connected.

5. Feedback & Improvements

- After testing the project, implement the feedback gained from classmates, teachers, or mentors and will make improvements based on suggestions.

What we have done

1. **Interactive Elements:** Sliders, booking forms, filtering system.
2. **UI Components:** Cards, modals, navigation elements

3. **Visual Design:** Color schemes, typography, imagery usage
4. **Vehicle Filtering System:** Type, price range, availability.

5. **Booking Process:** From selection to registration.

6. **User Authentication:** Login/signup flows.

7. **Dynamic Content Loading:** How vehicle data is displayed.

What's Remaining

1. About us page is to be designed.
2. Smart vehicle filtering system is to be redesigned and makes sure that it works smoothly.
3. More image gallery is to be added in the booking page.
4. Designing and to add more elements in login and registration page.
5. Footer for booking page is to be added.
6. The search function in the home page is still remaining to make it smoothly functional.
7. More vehicles is to be added and planes too.

Conclusion

In conclusion, our project aims to solve a real-life problem by providing an easy and organized way for people in Nepal to rent vehicles and book travel tickets online.

Using only frontend technologies like HTML, CSS, and JavaScript, we are planning to built a user-friendly website prototype that shows how this idea can work in the real world. This project not only helps users save time and plan better but also supports the vision of a Digital Nepal. It has been a great learning experience for all of us, and we look forward to improving it further in the future
